TISSUE-Embryonic fibroblast;
Shimizu T., Nikaido O., Suzuki F.;
Submitred (JUN-1996) to the EMBL/GenBank/DDBJ databases.

Submitted (JUN-1996) to the EMBL/GenBank/DDBJ databases.

In FUNCTION: Acts as a tumor suppressor in many tumor types; induces growth arrest or apoptosis depending on the physiological circumstances and cell type. Involved in cell cycle regulation as a trans-activator that acts to negatively regulate cell division by controlling a set of genes required for this process. One of the activated genes is an inhibitor of cyclin-dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                 BASIC (REPRESSION OF DNA-BINDING).

-!- SUBUNIT: Binds DNA as a homotetramer (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear.
-!- DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY
OF TRANSPORMED CELLS. P53 IS FREQUENTLY MUTATED OR INACTIVATED
IN MANY TYPES OF CANCER.
-!- SIMILARITY: BELONGS TO THE P53 PAMILY.

1 FUNCTION: ACTS AS ATUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCES GROWTH ARREST OR APPOPTOSIS DEPENDING ON THE PHYSIOLOGICAL CIRCUMSTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATION, IS A TRANS-ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE CELL DIVISION BY CONTROLLING A SET OF GENER REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVATED GENES IS AN INHIBITIOR OF CELLIN-DEPENDENT KINAGES. APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

A Lamb P., CrawGord L.;

Characterization of the human p53 gene.";

Mol. Cell. Biol. 6:1379-1385(1986).

-!- FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCES CROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSICLOCAICAL CIRCUMSTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATION, IS A TRANSCOTT TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATION, IS A TRANSCOTT TOWN SUPPRESSION BY ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.

ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.

APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION OF BCL-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                     "Isolation and characterization of a human p53 cDNA clone: expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              SUBCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).
DISERASE: PS3 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY OF TRANSFORMED CELLS. PS3 IS FREQUENTLY. WITATED OR INACTIVATED IN MANY TYPES OF CANCER (BY SIMILARITY).

CC G. 10:2879-2887(1991).

CC -!- FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCES GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL

CC GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSIOLOGICAL

TUMOR SUPPRESSION. ACTS IN GELL CYCLE REGULATION, IS A TRANS-

CC CONTROLLING A SET OF GENES REGULATE CELL DIVISION BY

CC CONTROLLING A SET OF GENES REQUIRANT ENCLESS. ONE OF THE

ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.

APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF

CC BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2

EXPRESSION (BY SIMILARITY).

CC -:- DISABASE F93 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY OF

TRANSFORMED CELLS. P53 IS FREQUENTLY, WUTATED OR INACTIVATED IN

CC -:- SIMILARITY: BELONGS (BY SIMILARITY).

CC -:- SIMILARITY: BELONGS (BY SIMILARITY).

C. 1- FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCES GROWTH ARREST OR APOPTOSIE DEPENDING ON THE PHYSIOLOGICAL CIRCUMSTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATION, 1S A TRANSCONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE ACTIVITED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.

ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.
APOPTOSIS INDUCTION SEEMS TO BE MEDIATED EITHER BY STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2
EXPRESSION (BY SIMILARITY).

--- SUBSCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

--- SIBSCELLULAR LOCATION: NUCLEAR (BY SIMILARITY).

--- SIBSCELLULAR TYPES OF CANCER (BY SIMILARITY).

--- SIMILARITY: BELONGS TO THE P53 PAMILY.

REMBL; X60019; CDAA2234.1; ---

--- SIMILARITY: BELONGS TO THE P53 PAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Plass M., Hartmann E., Mueller O., Kuhlmann J.;

Alfantification of a Sus scrofa gene encoding a protein with high
similarity to p53 from Homo sapiens, Bos taurus and Ovis aries.";
Submitted (JAN-1999) to the BMEL/GenBank/bDBJ databases.

-!- FUNCTION: ACTS AS A TUMOR SUPPRESSOR IN MANY TUMOR TYPES. INDUCES
GROWTH ARREST OR APOPTOSIS DEPENDING ON THE PHYSTOCOGICAL
CIRCUMSTANCES OR CELL TYPE, BUT BOTH ACTIVITIES ARE INVOLVED IN
TUMOR SUPPRESSION. ACTS IN CELL CYCLE REGULATE ARE INVOLVED IN
ACTIVATOR THAT ACTS TO NEGATIVELY REGULATE RECLL DIVISION BY
CONTROLLING A SET OF GENES REQUIRED FOR THIS PROCESS. ONE OF THE
ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.
ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.
ACTIVATED GENES IS AN INHIBITOR OF CYCLIN-DEPENDENT KINASES.
ACTIVATED GENES IS AN INHIBITOR OF STIMULATION OF BAX AND FAS ANTIGEN EXPRESSION, OR BY REPRESSION OF BCL-2
EXPRESSION (BY SIMILARITY).
--- SUBGELLULAR LOCATION; NUCLEAR (BY SIMILARITY).
--- SUBGELLULAR LOCATION; NUCLEAR (BY SIMILARITY).
--- DISEASE: P53 IS FOUND IN INCREASED AMOUNTS IN A WIDE VARIETY OF MANY TYPES OF CANCER.

MANY TYPES OF CANCER (BY SIMILARITY).
--- STANT AND TYPES OF CANCER (BY SIMILARITY).

No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.

R; Christiansen, A.; Hansen, A.C.; Vijn, I.; Pallisgard, N.; Larsen, K.; Yang, W.C.; Biss submitted to the EMBL Data Library, December 1995
A; Description: A novel type of DNA binding protein interacts with a conserved sequence in A; Reference number: Z1728
A; Accession: T1054
A; Accession: T1055
A; Molecule type: mRNA
A; Residues: 1-5 < CHR>
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Cydie: 31-Mar-1990 #sequence_revision 31-Mar-1990 #text_change 28-May-1999

qq

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

"Primary structure and biological activity of bradykinin potentiating peptides from Bothrops insularis snake venom.";

J. Protein Chem. 9:221-227(1990).

-!- FUNCTION: THIS PEPTIDE BOTH INHIBITS THE ACTIVITY OF THE ANOIOTENSIN-CONVERTING BNZYME AND ENHANCES THE ACTION OF BRADYKININ BY INHIBITING THE KINASES THAT INACTIVATE IT.

IT ACTS AS AN INDIRECT HYPOTENSIVE AGENT.

Purification and pore-forming activity of two hydrophobic polypeptides from the secretion of the Red sea moses sole (Pardachirus marmoratus).'.

Biol. Chem. 261:16704-16713(1986).

-!- FUNCTION: EXHIBITS UNUSUAL SHARK REPELLENT AND SURFACTANT PROPERTIES. FORMS VOLTAGE-DEPENDENT, ION-PERMEABLE CHANNELS IN MEMBRANES. AT HIGH CONCENTRATION CAUSES CELL MEMBRANE LYSIS.
-!- SUBGNAIT: MONOWER. IN ADUEDOUS SOLUTION EXISTS AS A TETRAMER.
-!- SUBCELULAR LOCATION: Secreted.
-!- SIMILARITY: BELONGS TO THE PARDAXIN FAMILY.

Bacteriol. 170:2749-2757(1988).
I. FUNCTION: TRANSFER GENE PROTEIN. IS INVOLVED IN THE CONJUGATION PROCESS OF BACTERIAL GELLS FOR THE EXCHANGE OF PLASMID DNA.
I. SUBGELLULAR LOCATION: Cytoplasmic.
I. SIMILARITY: TO TRAM PROTEIN OF OTHER PLASMIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 STRAIN=L2/434/Bu;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A Geneseq 101002:*

This invention describes a novel method for preparing a peptide or recombinant antibody, which mimics an antigenic carbohydrate. The peptides and recombinant antibodies prepared to mimic antigenic carbohydrates can be used to enhance binding of anti-antigenic carbohydrate antibodies to the antigenic carbohydrate, e.g. as vaccine carbohydrate antibodies to the antigenic carbohydrate, e.g. as vaccine adjuvants. The peptides to be used to inhibit binding of a ligand to a receptor, which is an antigenic carbohydrate. The methods are used to prepare the peptides and antigenic antibodies, which mimic the antigenic carbohydrates. Carbohydrate-conjugate vaccines could be used in tumour immunity and cancer therapy. The peptides and antibodies can also be used as antibacterials. Peptides that mimic carbohydrate antigens can be carbohydrate antigens can be committed to develop a longer lasting immune response. Other advantages of the peptides can be precisely defined; (2) the immunogenicity of the peptides can be precisely defined; (2) the immunogenicity of the peptides can be significantly enhanced by polymerization or addition or relatively small carrier molecules that reduce the total
                                                                                                                                                                                                         Mimotope, antigen, carbohydrate, antibody, mimic; vaccine, adjuvant, tumour immunity, cancer therapy, antibacterial, immune response, immunogenicity, anti-idiotype, T cell response manipulation.

Tumour metastasis requires detachment of malignant cells from the primary tumour, penetration of blood or lymph vessels and attachment to the endothelium of distant organs, ultimately resulting in the formation of new tumours. The selectin family of adhesion molecules is implicated in this process. E-selectin family of adhesion molecule significated in this process. E-selectin family of adhesion molecule spreased by activated vascular endothelium. E-selectins bind to glycoconjugates carrying a terminal tetrasaccharide Lewis antigen, which are found on tumour cell surfaces. One such Lewis antigen is Lewis Y (LeY). The binding of selectin molecules to their ligands is thought to be an important step in metastasis. Therefore, inhibition of E-selectin-dependent cancer therapy. The present sequence is a non planar-X-planar type motif. This motif is thought to bind to anti-LeY antibody BRS5-2. BRS5-2 is a peptido-mimetics of E-selectins. Peptides that block E-selectin-LeY binding and therefore adhesion of tumour cells and leukocytes to endothelial cells inhibit metastasis.
                                                                                                                                                                                                                               0
amount of antigen required for immunization; (3) peptide synthesis may be more practical than synthesis of carbohydrate-protein conjugates or the production of anti-idiotypes; (4) peptide minicking sequences can be engineered into DNA plasmids for DNA vaccination to further manipulate T cell responses. ANY33028-Y33308/ represent the carbohydrate antigen peptide mimotopes described in the invention.
                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Peptidomimetics of carbohydrate Lewis ligands useful for modulating

Peptides such as this are used to prevent or treat sex-hormone dependent disorders in human or veterinary medicine, esp. cancers (of the prostate, uterus, breast or pituitary), prostatemegaly, endometriosis, hysteromyoma or precocious puberty, but also amenorrhoea, premenstrual syndroma or precocious puberty, but comedo, etc.; also to control pregnancy (contraception for men or women, also to induce ovulation) and the menstrual cycle. They are also used to control osestrus in animals, to improve meat quality and control growth, and to promote spawning in fish. They may also inhibit the transient increase in testosterone blood levels caused by admin. of superagonists such as leuprorelin acetate.

The peptides were identified by modifying the p53 consensus binding sequence by substitution of an Alamine at each pos. and identifying which amino acid changes altered binding to expressed MDM2. The peptides and methods of identifying similar inhibitory peptides can be used to diagnose and treat e.g. cancer and other malignancies.
